p. 237

***Smeringopina camerunensis* n. sp.**

Taf. 24 Fig. 64-65; Taf. 25 Fig. 70-71.

♂ Beschreibung: Ceph nur wenig länger als breit. H des Clypeus 0·48 (= knapp 3facher Durchmesser der VM); der Clypeus gewölbt, nach ventral-vorn abfallend, glatt. Cheliceren (Fig. 70-71) frontal-lateral stark erweitert; der Fortsatz mit einem dorsalen, kegeligen und einem kleineren, lateralens Vorsprung, sowie einem nach vorn gerichteten, knotigen Teil, der grobe Kegeldorne trägt; vorn auf der Fläche der Cheliceren je 2 oder 3 eben-solche Dorne. Sternum breiter als lang (1·0:0·8).

Reihe der VA procurv, die untere Tangente der VS schneidet die Zentren der VM. HA schwach, doch deutlich recurv. VS<HS<HM<VM. VM um kaum $\frac{1}{3}$ ihres Radius voneinander und um $\frac{1}{3}$ ihres Radius von den VS ent-

p. 238

fernt. Abstand der HM etwa gleich ihrem Längsmesser (kaum meßbar größer). Das von den VM+HM gebildete Trapez wenig kürzer als hinten breit (0·45: 0·49).

Beine: Längenverhältnis der Fe I:II:IV:III, Fe I 9mal länger als der Ceph.

Pedipalpen (Fig. 64): Fe sehr dick, basal-lateral eine kurze, dunkel chitinisierte Kante. Pt und Ti ohne Besonderheiten. Ta abgeflacht-birnförmig, nach distal zapfenartig verlängert. Bulbus mit abgeflachter, bandförmiger Apophyse.

Abd 4 $\frac{1}{2}$ mal länger als breit.

Maße: Ceph L 1·7; B 1·5. — Abd L 4·6; B 1·0. — Ges L 6·4. — Fe I 15·5; II 11·9; III 9·0; IV 11·6.

A-Durchmesser: VM 0·17; VS 0·21; HM 0·18; HS 0·19. — Abstände: VM 0·03; VM-VS 0·03; HM 0·19.

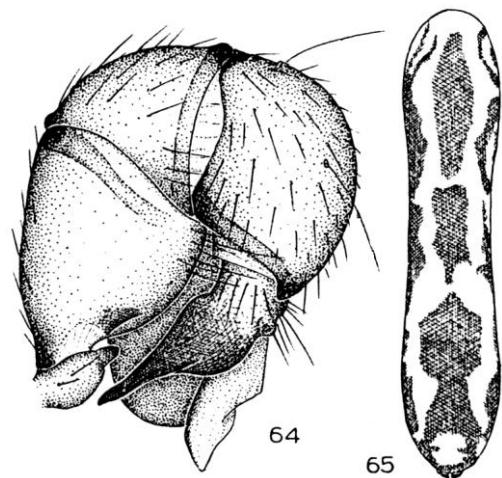

Färbung: Ceph hornbraun; eine Medianbinde nur kurz vor dem Hinterrand gerade angedeutet; dunkle, schmale Marginalbinden vorhanden. Clypeus lateral-jederseits angedeutet dunkel bereift, ebenso Sternum und Labium. Cheliceren horngelb, nur die Apophysen hornbraun. Abd dorsal Fig. 65; lateral schmale, ± durchlaufende, helle Längszonen; ventral mit dunkler Medianbinde, die in den beiden vorderen, sowie im hinteren Viertel durch eine breite, helle Längszone geteilt ist.

Material und Vorkommen: Kamerun: Duala (1♂ Holotypus SMF 9814).

Figs. 469–473, 509–510, 525, 541–546

Smeringopina camerunensis Kraus 1957: 237–238, figs. 64–65, 70–71.

Type. ♂ holotype from Cameroon, Duala [=Douala, 4°03.0'N, 9°42.6'E], 16.xii.1913 (A. Haas), in SMF (9814/1), examined.

Other material examined. CAMEROON: *Littoral Region*: degraded forest fragment near Douala (4°00.6'N, 9°47.9'E), 25 m a.s.l., near ground, 6.iv.2009 (B.A. & J.C. Huber), 2♂1♀ in ZFMK (Ar 10260); same data, 1♂4♀ 1 juv. in pure ethanol, in ZFMK (Cam 149). Near Edéa, Koukoué (3°41.2'N, 10°06.4'E), 50 m a.s.l., near ground, 8.iv.2009 (B.A. & J.C. Huber), 1♀ in ZFMK (Ar 10261). *Southwest Region*: Matute, Tiko Plantation [Tiko: 4°04.7'N, 9°21.6'E], 24.iv.–6.v.1949 (B. Malkin), 2♀ in CAS.

Diagnosis. Distinguished from similar congeners (large species with long abdomen, cone-shaped modified hairs on male chelicerae, simple unbranched procursus) by distinctively wide and weakly sclerotized tip of procursus (Figs. 541–542), very wide and rounded distal male cheliceral apophyses (Fig. 543), and anterior epigynal plate with small central projection in lateral view (Fig. 510; smaller than in *S. africana*).

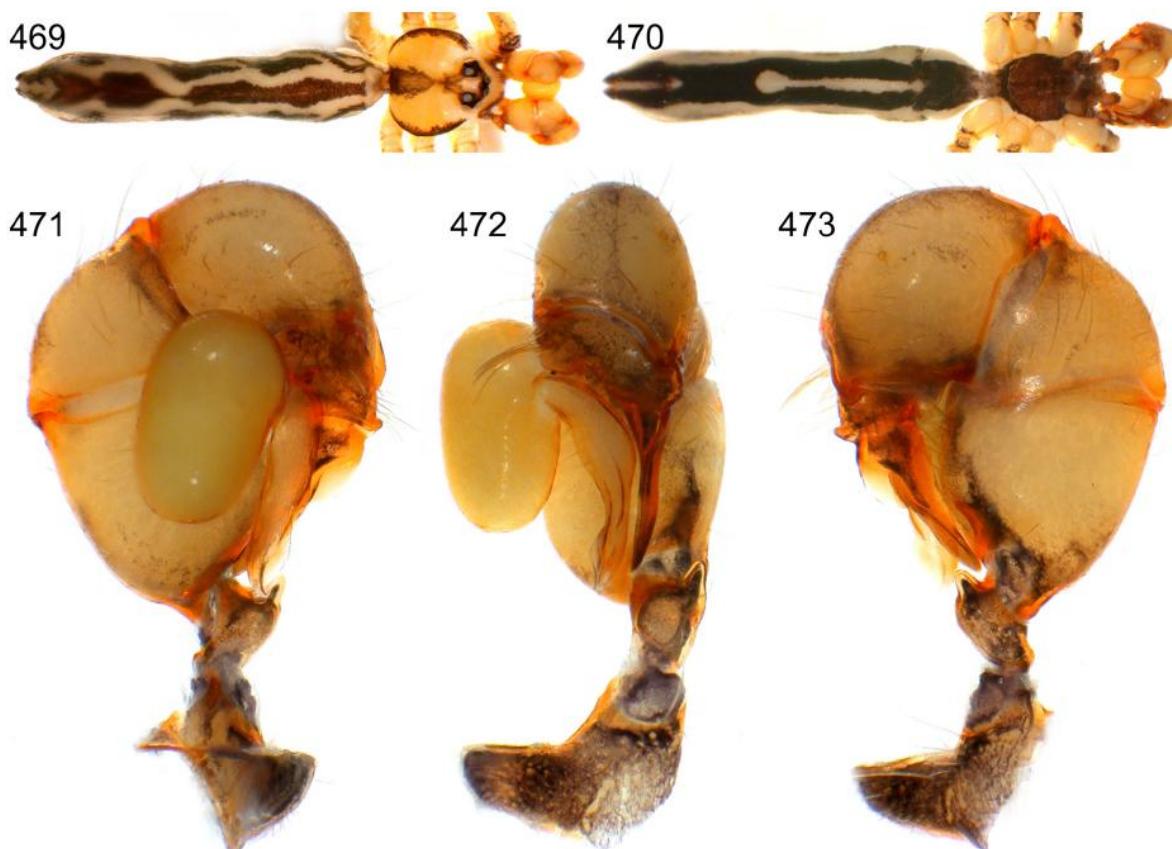

Male (near Douala, ZFMK). Total body length 7.0, carapace width 1.6. Leg 1: 71.4 (16.1 + 0.7 + 15.7 + 35.7 + 3.2), tibia 2: 10.9, tibia 3: 7.5, tibia 4: 10.1; tibia 1 L/d: 104. Distance PME-PME 230 µm, diameter PME 150 µm, distance PME-ALE 70 µm, distance AME-AME 30 µm, diameter AME 160 µm. Carapace ochre-yellow with brown mark posteriorly and brown lateral margins; ocular area posteriorly brown, clypeus distally brown, sternum dark brown; legs ochre-yellow, slightly darker rings subdistally on femora and tibiae and in patella area, tips of femora and tibiae whitish; abdomen ochre-gray with distinct black pattern dorsally, laterally, and ventrally. Habitus as in Figs. 469–470, ocular area slightly elevated, secondary eyes with distinct ‘pseudo-lenses’; clypeus unmodified except longer than usual hairs; deep thoracic pit and pair of shallow furrows diverging behind pit. Chelicerae as in Fig. 543, with lateral proximal apophyses and wide and rounded distal apophyses, the latter and frontal cheliceral face provided with several modified (cone-shaped) hairs. Palps as in Figs. 471–473; coxa unmodified; trochanter with simple retrolatero-ventral apophysis; femur proximally with ventral sclerotized ridge, without or with very indistinct shallow pocket, with barely visible retrolateral hump, without prolateral modification; prolateral femur-patella joint strongly shifted toward ventrally; tarsus with some stronger hairs dorsally; procursus with fairly distinct hinge dividing proximal from distal part (Fig. 541), with wide and weakly sclerotized tip; bulb with widened but weakly sclerotized proximal part of embolus (Fig. 544). Legs without spines and curved hairs, with few vertical hairs, retrolateral trichobothrium on tibia 1 at 1%; prolateral trichobothrium present on all tibiae; pseudosegments barely visible.

Variation. Number of modified hairs frontally on male chelicerae slightly variable. Tibia 1 in other male from near Douala: 16.1. Holotype in fair condition, very bleached, both palps detached; tibia 1 missing (femur 1: 15.2); with 2 and 4 modified hairs respectively on each cheliceral basis.

Female. In general similar to male; clypeus with shorter hairs; sternum and clypeus variably dark. Tibia I in 4 females: 12.1, 12.5, 12.5, 13.3. Epigynum relatively small, consisting of trapezoidal anterior plate with small central projection and large posterior plate (Figs. 509–510, 545); internal genitalia as in Figs. 525 and 546.

Natural history. The newly collected specimens were found in a small patch of degraded swampy forest. They were not rare and built their large domed webs in sheltered spaces very close to the ground.

Distribution. Known from four localities in southwestern Cameroon (Fig. 468).
